

Carlson Filtration Distributors' Sales Bulletin

New Updated Filtration Application Brochures

Carlson has recently published new updated versions of two filtration application brochures.

Firstly, the new Carlvín brochure gives lots of useful information about how Carlson Filtration products are used in primary, intermediate and final filtration stages of the wine making process. The new publication also discusses how Turbidity (NTU) and the Filterability (or Fouling) Index (FI) can be used as important measures to assess the efficiency of intermediate filtration and hence protect and extend final stage membrane filter life.

There is a section that deals with filtration of other products derived from wine, including brandy, champagne, liqueurs, sherry, fortified wines and wine vinegars.

Secondly, the new Carlbrew publication discusses the use of Carlson's filtration products in the brewing industry.

This brochure shows how to apply Carlson's range to all three filtration stages that are commonly used in beer and lager production;

- ◆ 1st stage filtration, which is usually supported by the addition of a filter aid such as kieselguhr or diatomaceous earth
- ◆ Pre-filtration or guard filtration which removes the bulk of remaining impurities and protects the final sterile filtration stage
- ◆ The polishing stage itself, prior to packaging

Printed versions of both new brochures are available now. Please get in touch with your usual Carlson contact for more details.

PDF versions of the new updated brochures will be available soon in the wine (Carlvín) and brewing (Carlbrew) application sections of the web site.

purity through quality™ since 1923
